Let’s Look at arrays of different types

Arrays can store any type of data

Let’s look at some examples:

1. Array of primitives - **int**
2. Array of objects – **String**
3. Array of objects - **Product**

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];

byte smallNumbers[] = new byte[4];

char characters[] = new char[26];
```

Object Types

```
String[] words = new String[4];

Product products[] = new Product[10];
```

1) Array of **Primitives**
e.g. int

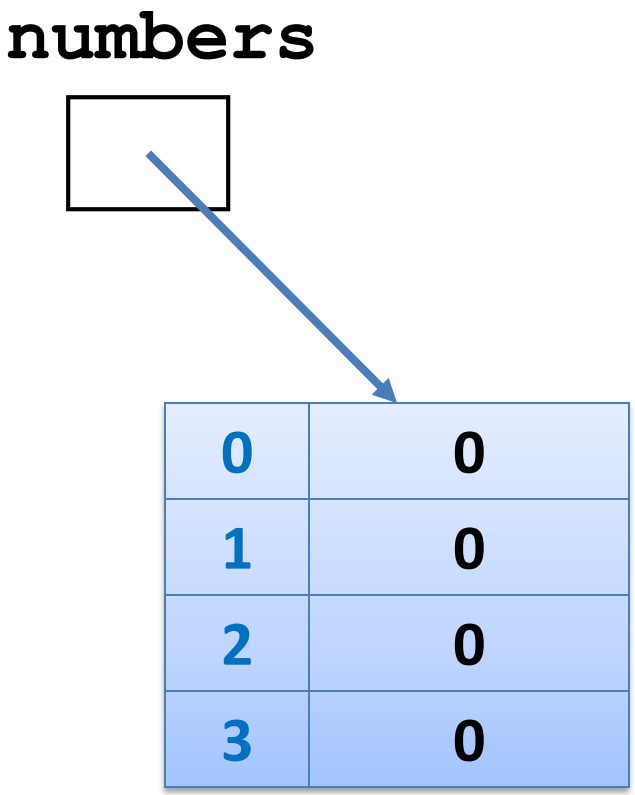
Structure of an **int** primitive array

```
int[] numbers;
```

Structure of an **int** primitive array

```
int[]  numbers;
```

```
numbers = new int[4];
```



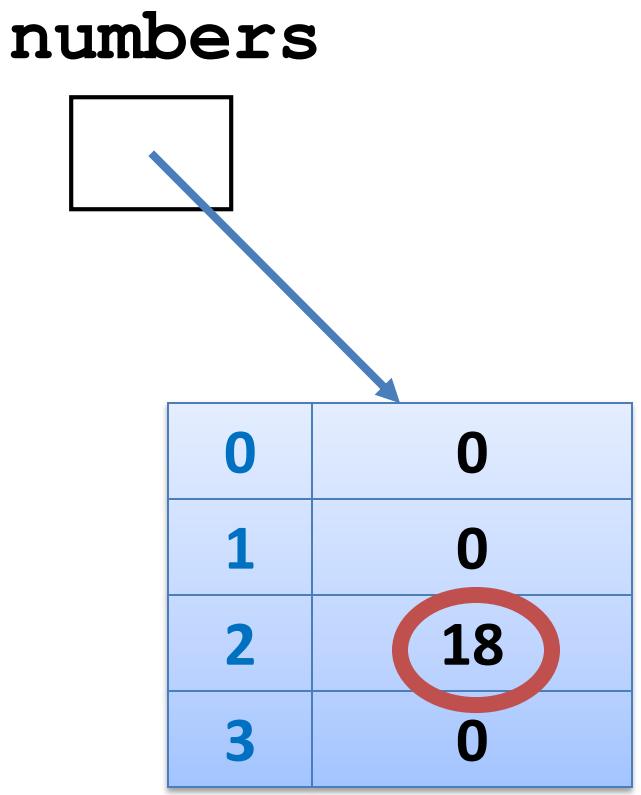
Structure of an **int** primitive array

```
int[]  numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

We are directly accessing the element at index **2** and setting it to a value of **18**.



Structure of an **int** primitive array

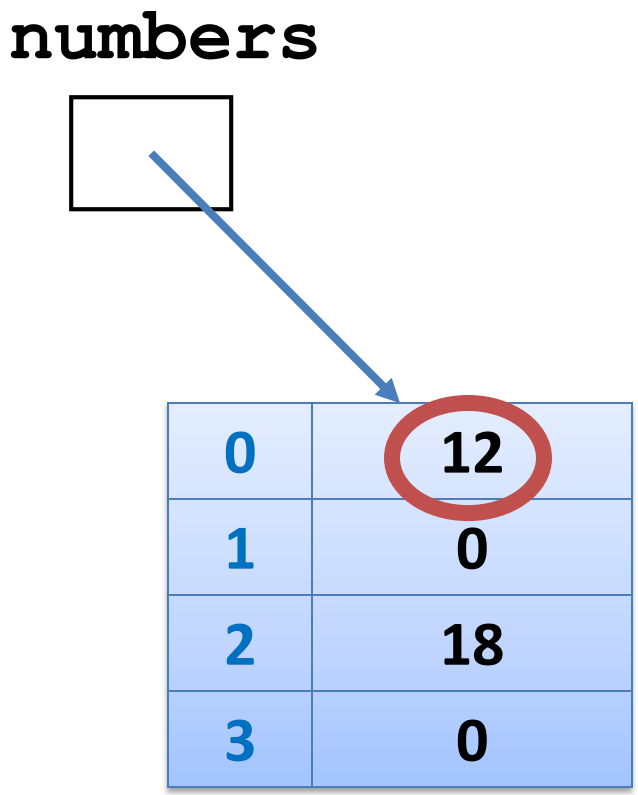
```
int[]  numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

```
numbers[0] = 12;
```

We are setting the element at index **0** to a value of **12**.



Structure of an **int** primitive array

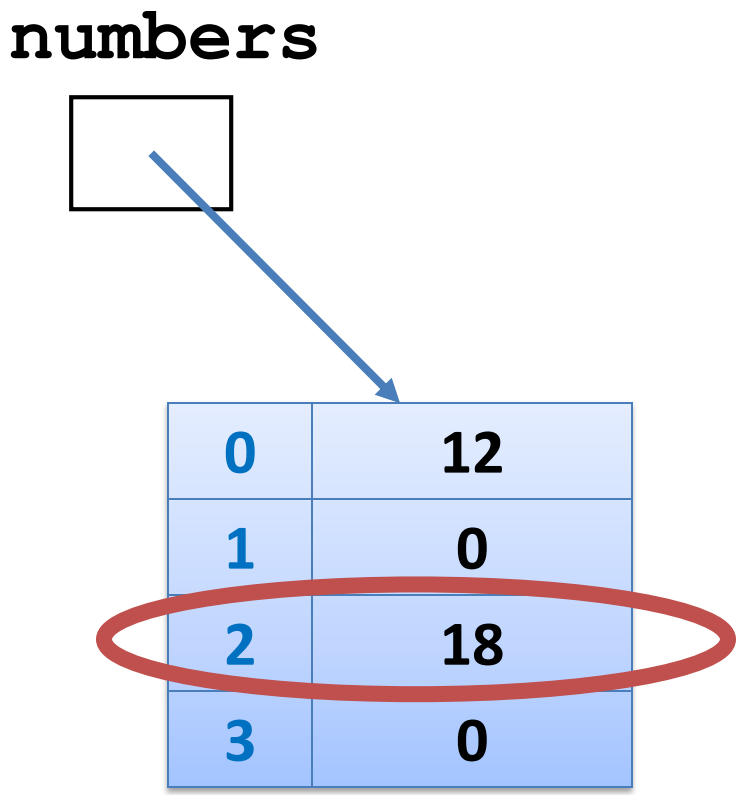
```
int[]  numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

```
numbers[0] = 12;
```

```
print(numbers[2]);
```



Here we are printing the contents of index location 2
i.e. 18 will be printed to the console.

2) Array of **Objects**
e.g. String

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];

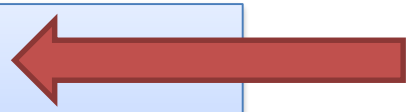
byte smallNumbers[] = new byte[4];

char characters[] = new char[26];
```

Object Types

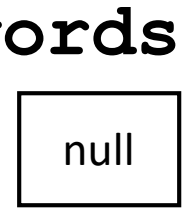
```
String[] words = new String[4];

Product products[] = new Product[10];
```



Structure of a **String** object array

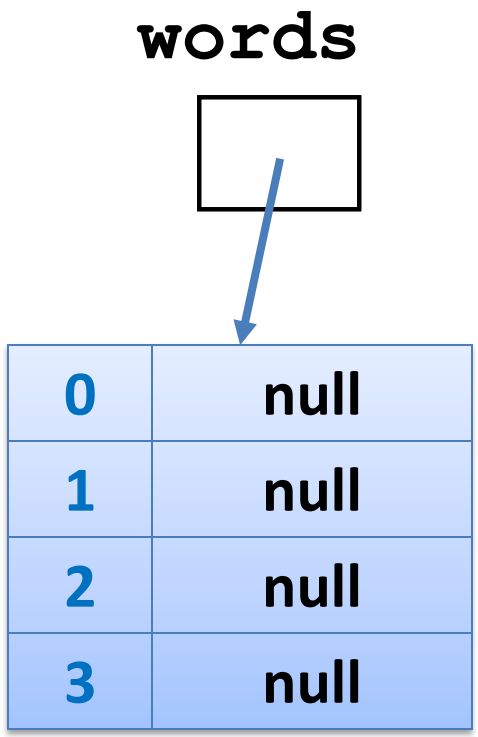
```
String[]  words;
```



Structure of a **String** object array

```
String[]  words;
```

```
words = new String[4];
```

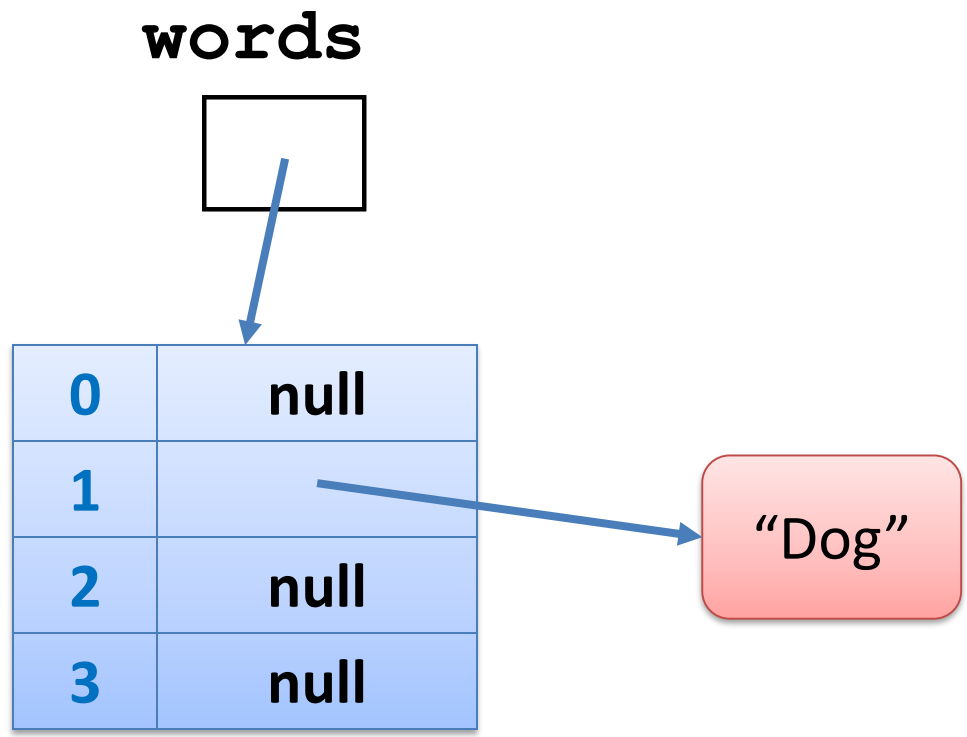


Structure of a **String** object array

```
String[]  words;
```

```
words = new String[4];
```

```
words[1] = “Dog”;
```



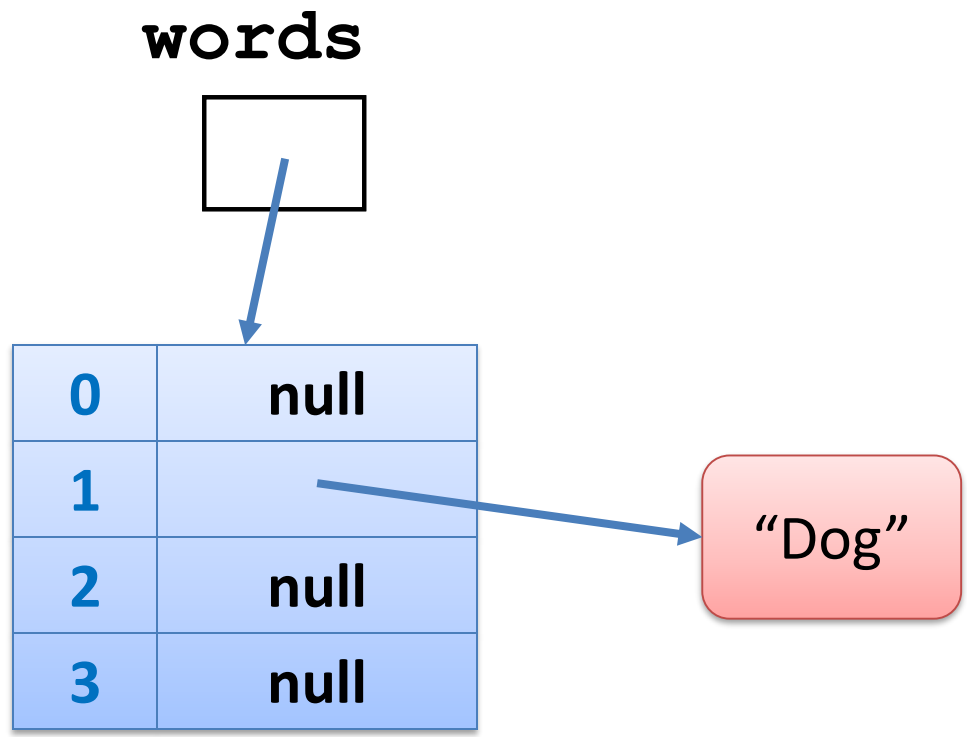
Structure of a **String** object array

```
String[]  words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

We are directly accessing the element at index **1** and setting it to a value of **"Dog"**.



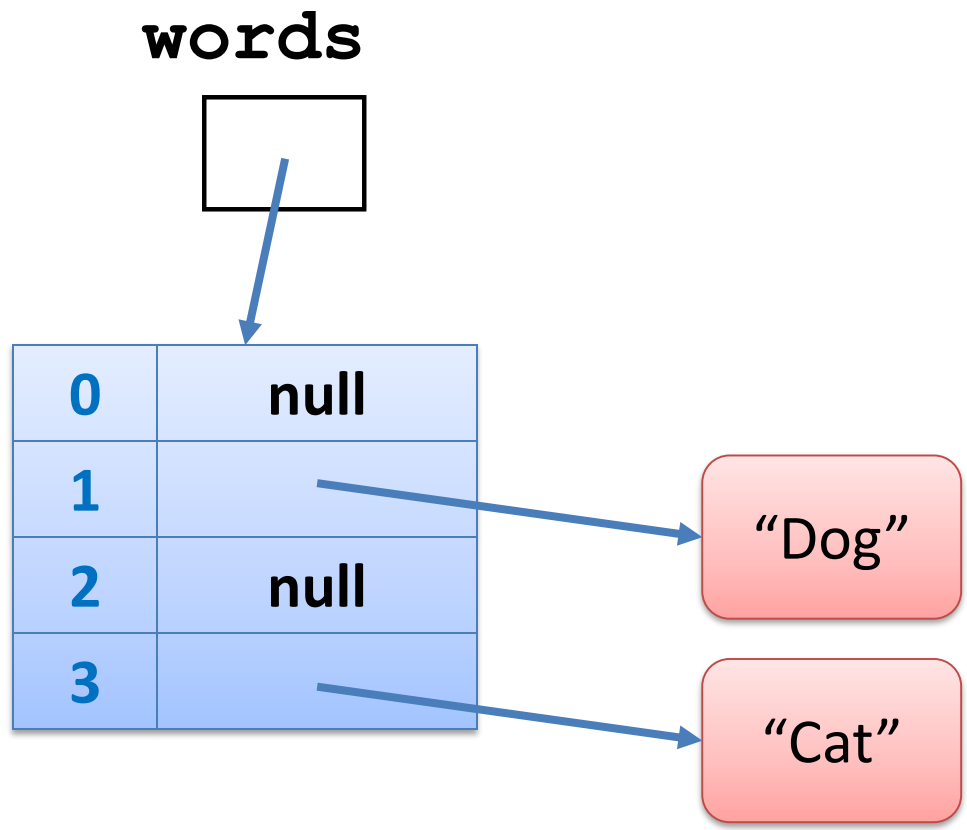
Structure of a **String** object array

```
String[]  words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

```
words[3] = "Cat";
```



Structure of a **String** object array

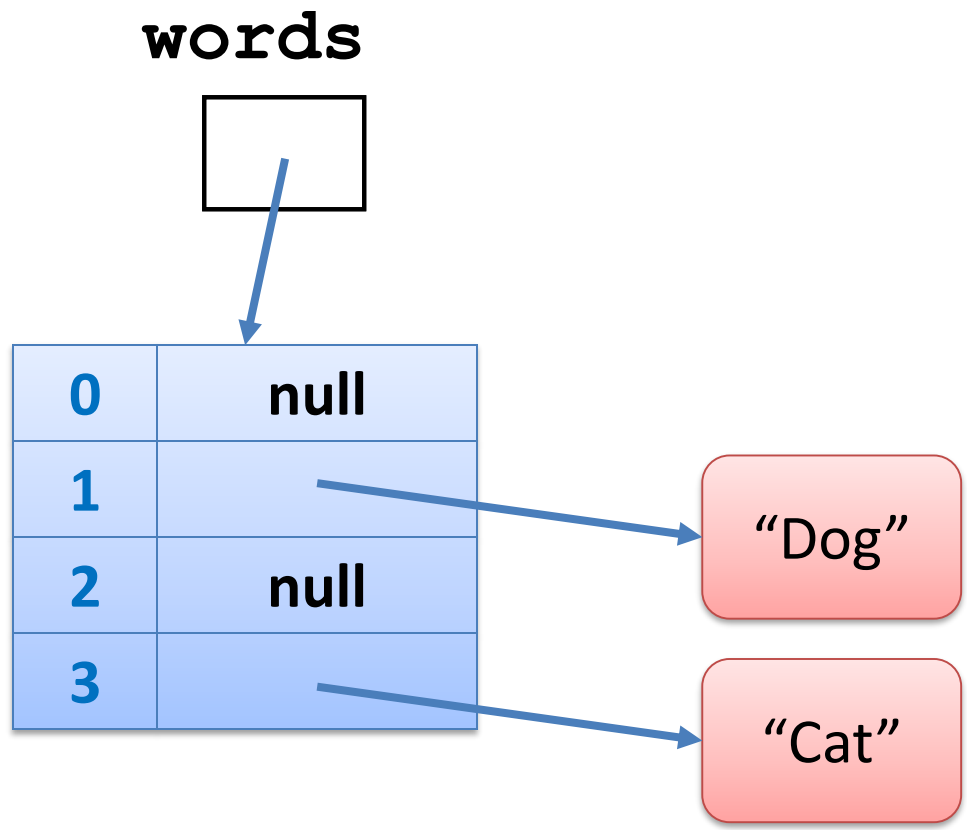
```
String[]  words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

```
words[3] = "Cat";
```

The element at index **3** is set to **"Cat"**.



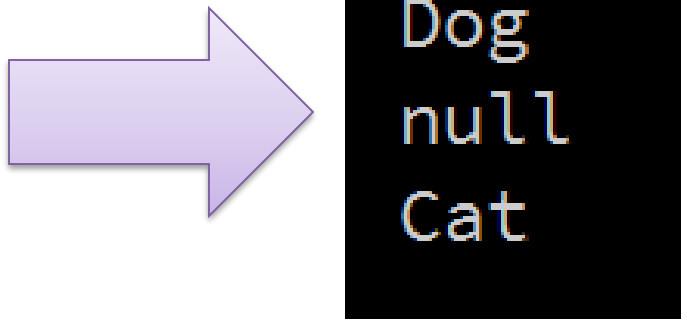
Structure of a **String** object array

```
String words[];

words = new String[4];

words[1] = "Dog";
words[3] = "Cat";

for (int i=0; i < words.length; i++)
{
   System.out.println(words[i]);
}
```



3) Array of **Objects**
e.g. Product

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];

byte smallNumbers[] = new byte[4];

char characters[] = new char[26];
```

Object Types

```
String[] words = new String[4];

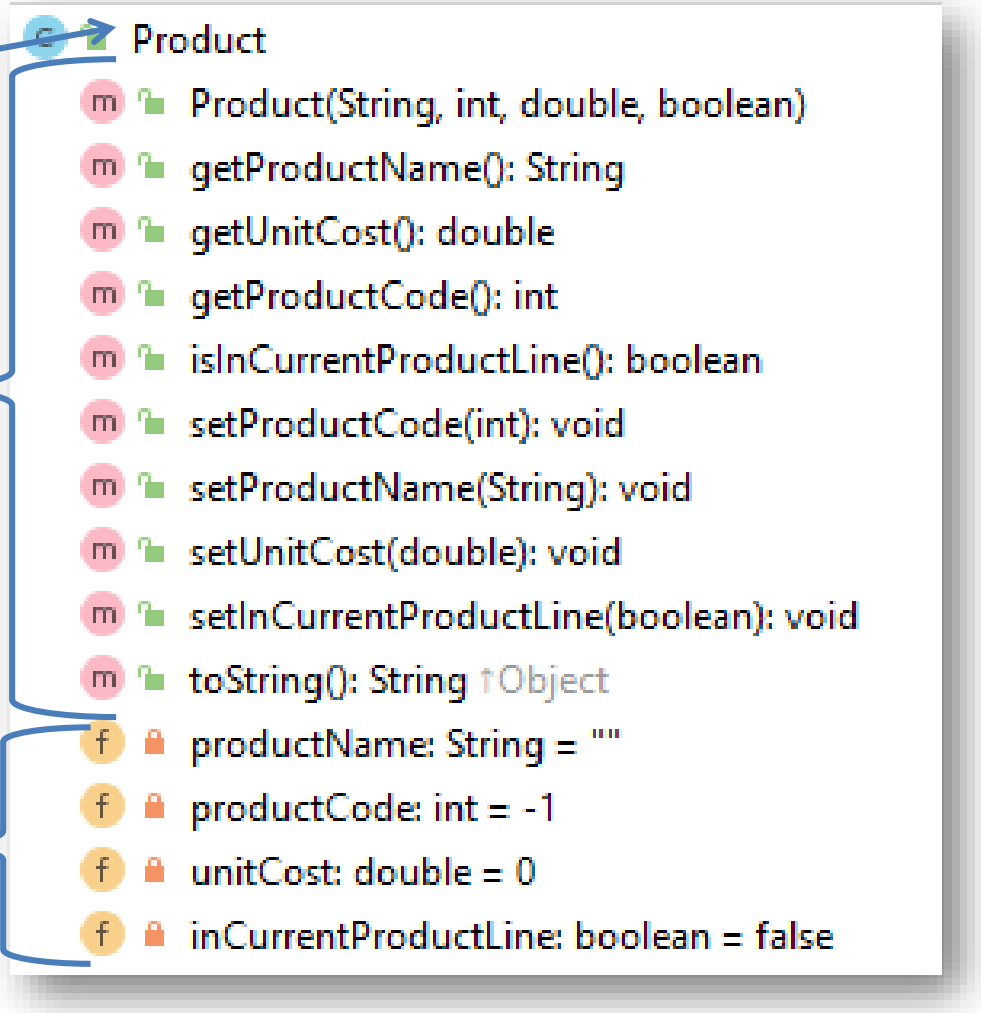
Product products[] = new Product[10];
```

Product Class

Object Type/
Class Name

Methods
i.e. the behaviours of the class

Fields
i.e. the attributes of the class



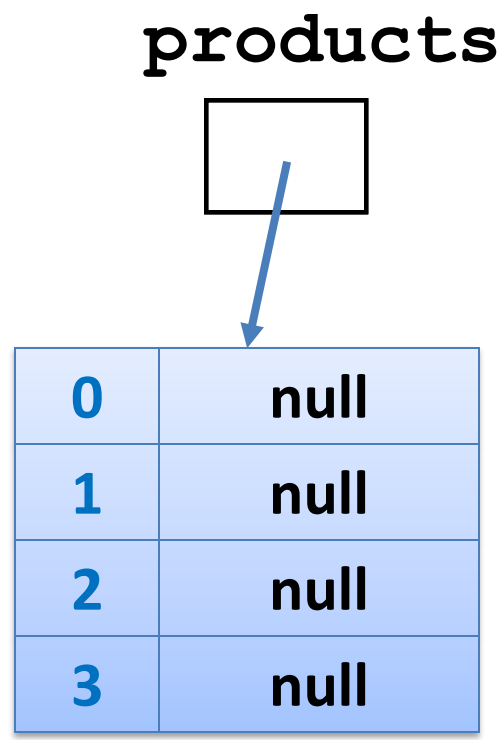
Structure of a **Product** primitive array

```
Product[] products;
```

Structure of a **Product** primitive array

```
Product[] products;
```

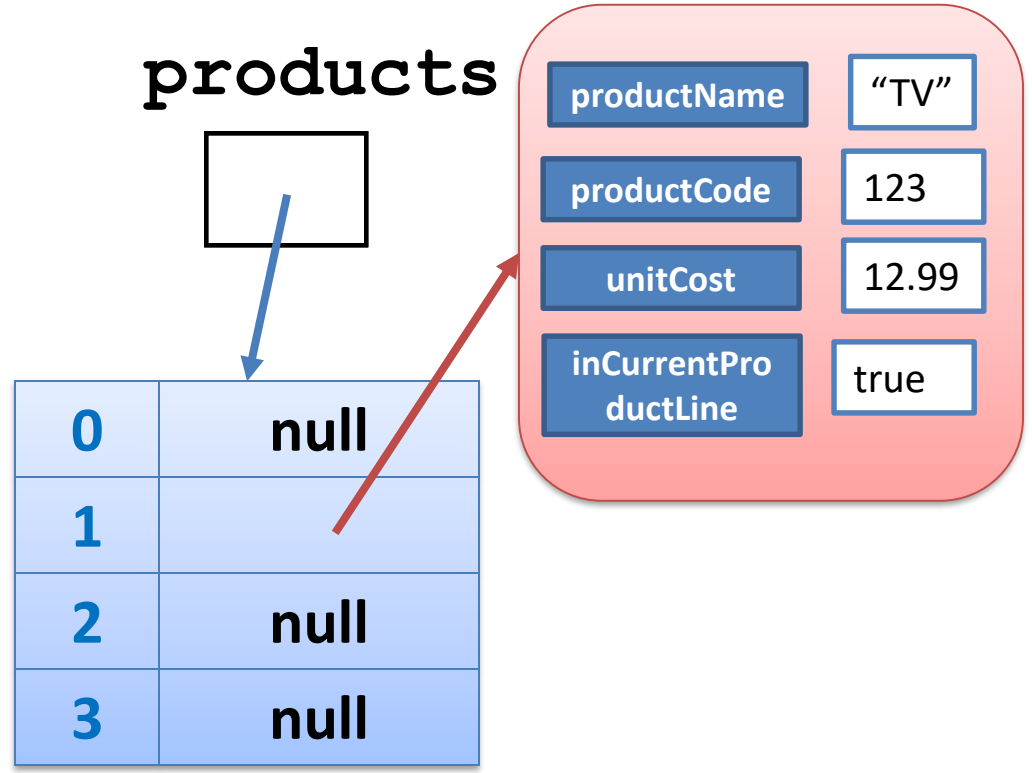
```
products = new Product[4];
```



Structure of a **Product** primitive array

```
Product[] products;
```

```
products = new Product[4];
```



```
products[1] =  new Product("TV", 123, 12.99, true);
```

Example using a **Product** object array

```
public String listProducts() {

        String listOfProducts = "";

        for (int i = 0; i < total; i++) {
            listOfProducts += i + ": " + products[i].toString() +
"\n";
        }

        return listOfProducts;
    }
}
```

Returns a String containing all the products stored in the primitive array.
