

Client Video Script – “Pat Purrs, Pet DayCare Owner”

[Camera on. Pat Purrs smiles warmly.]

Pat:

Hi everyone! My name is **Pat Purrs**, and I run **Paws & Whiskers DayCare**, where we look after pets while their humans are off working, travelling, or just catching a break. Thank you for taking on this project—I’m really excited to work with all of you.

So, let me tell you what I need.

1. A User-Friendly System — Starting With Console

Right now, everything in my business is done with paper forms and a lot of sticky notes...
...and I mean a *lot* of sticky notes.

What I’d really like is a **simple, clean, user-friendly console system** that lets staff:

- Register a pet,
- Choose whether it’s a **cat or a dog**,
- Record important details,
- See who’s in the daycare,
- See who is neutered and who is not
- Identify Dangerous breeds.
- And keep everything tidy and accurate.

Even though this first version is console-based, I need you to **design it as if it could evolve**. The plan is to eventually turn this into:

👉 **A full mobile app.**

So please keep the code organised and well-structured—especially the Driver class. That way, when we move to a mobile UI later, we won’t have to rewrite the whole thing.

2. Designed for Growth

Right now, we can comfortably handle **up to 90 pets**.

But business is booming, and we’re already planning to expand.

That means your system should:

- Avoid hard-coded limits,

- Work smoothly regardless of the number of pets,
- Be flexible if our capacity grows—because it *will*.

And speaking of growth...

3. More Animals Coming Soon

We currently care for **cats and dogs**, which is why they're your main focus.

But we're hoping to add:

Rabbits — and maybe more animals after that!

So please design your classes using **inheritance** in a way that makes adding new animal types easy and clean.

If I want to introduce ferrets, parrots, alpacas... who knows!

Your design should make that possible without tearing everything apart.

4. A Cautionary Tale — Learn From My Friend's Mistake

Now, before you start, let me show you something.

[A short cutaway moment: Cat holds up a phone or gestures to an image off-screen.]

This is an app my friend got developed for their pet service.

It looks okay at first glance, but... well... here's the problem:

- All the code was written in one giant class,
- Nothing was separated properly,
- There was no clear model or controller,
- And everything was tightly tied to the console interface.

Which meant...

When they wanted to update the app—

or change the interface—

or add new animals—

or basically *do anything at all*...

...the whole thing had to be rewritten from scratch.

I *do not* want that happening to my system.

That's why I'm here with **you**.

I want a system that's:

- Well-structured
 - Flexible
 - Extensible
 - Easy to maintain
 - And professional-quality
-

5. Your Mission

So your job is to build the **console-based Driver** that my staff can use right now, *but with the future in mind*.

Think of the Driver like the “temporary front door” to the system.

The **real logic** should live in the model and controller.

That way, when we eventually build a mobile app, we can simply replace the console Driver with a shiny new interface.

Pat (closing):

Thank you so much for taking this on. I'm genuinely excited to see what you create. My pets—and their humans—are counting on you!

Good luck, and I can't wait to see your design.

[Pat waves.]

See you soon!
