

Programming Fundamentals 2

Topic 04 - Tutorial Sheet 4.3

Utility Classes and Reusable Validation

Exercise 1: Design a Range Validation Method

You now want **one reusable method** that checks if a number is within a range.

👉 Write a method that:

- is `public` and `static`
 - returns `boolean`
 - takes **three parameters**:
 - number to check
 - minimum value
 - maximum value
 - returns `true` only if the number is within range (inclusive)
-

Exercise 2: Write a String Length Validator

👉 Write a utility method that:

- checks if a string is **no longer than a given maximum**
 - returns a `boolean`
 - does not modify the string
-

Exercise 3: Write a String Truncation Method

Sometimes we want to **fix** bad input rather than reject it.

👉 Write another utility method that:

- takes a `String` and a maximum length
 - returns:
 - the original string if it is short enough
 - a truncated version otherwise
-
