

ASCII Conversion

ASCII (American Standard Code for Information Interchange) is a standard character encoding used in telecommunication. A character encoding standard that assigns unique numerical values to letters, digits, punctuation marks, and other symbols. ASCII codes are used to represent alphanumeric data.

Why do we need ASCII Value Representation

Computers do not understand human languages directly. They operate using binary data made up of 0s and 1s. ASCII provides a bridge between human-readable characters and machine-readable binary code by assigning a unique number to each character.

- Each character is assigned a unique ASCII value ranging from 0 to 127.
- Uppercase letters, lowercase letters, digits, and symbols all have different ASCII values.
- Example: 'A' = 65, 'a' = 97, '0' = 48
